

VENASEAL™ 'Vein Glue'

The U.S. Food and Drug Administration (FDA) approved the VenaSeal™ closure system to permanently treat varicose veins by sealing the affected superficial veins using an adhesive agent.

The VenaSeal™ Sapheon Closure System

is a unique, minimally invasive treatment that uses a safe-for-the-body medical glue to quickly and effectively treat varicose veins (venous reflux disease). Using ultrasound, a doctor will guide a tiny catheter through a small access site in the skin and into the diseased area of the vein. Next, the VenaSeal™ dispenser delivers a very small amount of medical glue to close the vein. Once the affected vein is closed, blood is immediately re-routed through other healthy veins in the leg.

Unlike other treatments, VenaSeal™ does not require anesthesia to be injected into the leg via multiple needle sticks (tumescent anesthesia), and because there are no pre-procedure drugs involved, patients can return to their normal activities right after the treatment. Unlike heat-based procedures, with VenaSeal™ there is no risk of skin burns or nerve damage. VenaSeal™ usually does not require any post-treatment pain medication or uncomfortable compression stockings.'

The VenaSeal™ closure system is the only non-tumescent, non-thermal, non-sclerosant procedure that uses a proprietary medical adhesive delivered endovenously to close the vein. This unique approach eliminates the risk of nerve injury when treating the small saphenous vein, which is a risk sometimes associated with certain thermal-based procedures. Clinical studies have demonstrated that the procedure is safe and effective.

Call La Jolla Vein & Vascular at 858-550-0330 to find out if VenaSeal™ is a good option for your vein treatment!
